Problem Statement

Currency exchange requires real-time rate management and accurate conversion.

This projects simulates forex operations.

Solution

I developed a menu-driven Currency Exchange & Forex Management System using C++.

The system:

- Converts multiple currencies (INR, USD, EUR, GBP, JPY, AUD)
- Stores transaction details in a file
- Records date and time of each transaction
- Displays total number of transactions
- Allows users to view transaction history

The system is simple, user-friendly, and demonstrates practical use of C++ concepts.

Working Process

Step 1: User selects option from menu

Step 2: User selects From and To currency

Step 3: User enters amount

Step 4: System calculates using exchange rate

Step 5: Converted amount is displayed

Step 6: Transaction is saved with date & time

Step 7: Total transaction count is updated

Conclusion

The Currency Exchange & Forex System successfully performs currency conversion and maintains transaction records.

This project helped in understanding C++ concepts like functions, file handling, loops, and real-world problem solving.

It can be further enhanced with live exchange rates and graphical interface.
